Exit All Positions

Use this API to exit all open positions in one go. You can filter by `segment` or `tag` to exit specific positions, or exit all open positions with a single request. The `order_id`s of the new orders created to square off will be returned in the response.

MARKET PRICE PROTECTION ON EXIT ORDERS

This API squares off positions using **MARKET** orders. **Market Price Protection (MPP)** is applied by default to those orders. For more details, see Market Protection details.

Request

```
curl --location --request POST
'https://api.upstox.com/v2/order/positions/exit' \
--header 'Content-Type: application/json' \
--header 'Accept: application/json' \
--header 'Authorization: Bearer {your_access_token}'
```

For additional samples in various languages, please refer to the Sample code section on this page.

Query Parameters

Name	Required	Type	Description
segment	false	string	The segment associated with the positions. Possible values: `NSE_EQ`, `BSE_EQ`, `NSE_FO`, `BSE_FO`, `MCX_FO`, `NCD_FO`, `BCD_FO`, `NSE_COM`.
tag	false	string	The tag associated with the positions. Check the Understanding How the Order Tag Filter Works section for a detailed explanation on how filtering by order tag works.

Order Tag Scenario

An order tag is a feature that allows traders to categorize or label their orders for better tracking and management. However, it is important to note that **order tags are only valid for intraday positions**. They are specifically designed for trades that are opened and closed within the same trading session.

When a position is carried forward to the next trading day, the order tag associated with it becomes invalid or irrelevant. This is because carry-forwarded positions are no longer tied to the context of the original trading session where the tag was applied.

For carry-forward positions, use a general exit approach without filtering by tags.

Order Execution Sequence

The system will execute all **BUY** positions first, followed by the execution of all **SELL** orders. This ensures a consistent and orderly processing of multiple order types within the same request.

Maximum Position Limit

When slicing is applied, we calculate the total number of resulting orders. The total number of orders in a request, including those generated by the slice, must not exceed the maximum position count specified here.

Responses 2XX 4XX

Response Body

Success (200) **Partial Success (207)**

```
{
    "status": "success",
    "data": {
        "order_ids": [
            "1644490272000",
            "1644490272001",
            "1644490272003"
        ]
```

```
    },
    "errors": null,
    "summary": {
        "total": 3,
        "success": 3,
        "error": 0
    }
}
```

Name	Type	Description
status	string	A string indicating the outcome of the request. Possible values: `success`, `partial_success`, `error`. **success** - when all positions were exit successfully. **partial_success** - when some positions encountered errors. **error** - when all the positions encountered errors.
data	object	Successful response data for exit all positions request.
data.order_ids	array	List of reference order IDs associated with successful exit positions.
errors	array	An array containing the main content of the error response for `partial_success` and `error` scenarios.
errors[].error_code	string	A specific error code.
errors[].message	string	Descriptive error message.
errors[].property_path	string	Indicates which part of the request triggered the error. It can be null.
errors[].invalid_value	string	Shows the value causing the error. It can be null.

Name	Type	Description
errors[].instrument_key	string	A Key of instrument for a specific position.
errors[].order_id	string	Order ID associated to specific position. It can be null.
summary	object	A summary of the outcomes for the batch of orders processed, detailing total orders, successful completions, and errors.
summary.total	integer	The total number of order present in the payload for exit positions.
summary.success	integer	Indicates the successful orders placed for exit positions.
summary.error	integer	Indicates the unsuccessful orders placed for exit positions.

Auto Slicing

Exchanges enforce a limitation on the maximum quantity that can be placed for any scrip, known as the `freeze` quantity. If an order exceeds this freeze quantity, it will be rejected by the exchange. To simplify the process and prevent such rejections, we automatically `slice` the order into smaller parts based on the freeze quantity defined by the exchange when necessary.

For example:

If you want to exit position for *SCRIP1* with a total quantity of 10,100, and the freeze quantity defined by the exchange is 1,000, then the system will automatically split the position into 11 smaller for execution: 10 positions of 1,000 quantity each, and 1 position of 100 quantity. This ensures that all quantities are accepted and processed by the exchange.

Understanding How the Order Tag Filter Works

How Positions work

When you place multiple orders for the same `instrument_key`, your positions are aggregated based on the total quantity, not by individual orders. This means positions are not identifiable by specific order numbers.

What happens when you filter by Tag?

When you use the Exit Position API with a `tag` filter, the system identifies orders associated with that tag and calculates the total quantity for each `instrument_key`. It then creates a square-off order for that quantity to exit the position. Note that the square-off is performed based on quantity, not on individual orders.

Let's illustrate how this will work with an example:

1. **Order 1:** You buy 100 shares of `ABC_CORP` with the tag `Strategy_A`.
2. **Order 2:** You buy 50 shares of `ABC_CORP` with the tag `Strategy_B`.

Your position for `ABC_CORP` now shows a total of **150 shares**.

Now, you decide to exit positions associated with `Strategy_A`:

- You call the Exit All API with `tag=Strategy_A`.
- The system identifies that `Strategy_A` is associated with `ABC_CORP` for **100 shares**.
- A square-off order is created to sell **100 shares** of `ABC_CORP`.

Key Takeaway

When exiting positions using a tag filter, the system squares off based on total quantities per instrument, not individual orders or tags. Therefore, if you have multiple positions in the same instrument with different tags, exiting positions with a specific tag may impact your overall position in that instrument beyond the intended tag.

Sample Code

Exit all the open positions

Curl | Python | Node.js | Java | PHP | Python SDK | Node.js SDK | Java SDK

```
curl --location --request POST
'https://api.upstox.com/v2/order/positions/exit' \
--header 'Content-Type: application/json' \
```

```
--header 'Accept: application/json' \
--header 'Authorization: Bearer {your_access_token}' \
```

Exit all the open positions for a given segment

Curl | Python | Node.js | Java | PHP | Python SDK | Node.js SDK | Java SDK

```
curl --location --request POST
'https://api.upstox.com/v2/order/positions/exit?segment=NSE_FO' \
--header 'Content-Type: application/json' \
--header 'Accept: application/json' \
--header 'Authorization: Bearer {your_access_token}' \
```

Exit all the open positions for a given tag

Curl | Python | Node.js | Java | PHP | Python SDK | Node.js SDK | Java SDK

```
curl --location --request POST
'https://api.upstox.com/v2/order/positions/exit?tag=xyz' \
--header 'Content-Type: application/json' \
--header 'Accept: application/json' \
--header 'Authorization: Bearer {your_access_token}' \
```

POST /order/positions/exit

Request

LIVE URL
https://api.upstox.com/v2

+ Show optional parameters

Important

- This API does not support exiting positions for `Delivery` orders in the `EQ` segment.
- This API will place a opposite leg `MARKET` order for each position.
- This API will be applicable during the market segment's trading hours.

- Auto slicing is enabled by default for this API. Click here for more details.

Exit Positions Limits and Rate Limits

- A maximum of **10 positions** can be exit in a single request. Any request exceeding this limit will be rejected.
- The Exit Positions API is subject to a different rate limit compared to the standard limits applied across the system. For more information on the rate limits for this API, please check here.
